

INGREDIA APP STORE READINESS CHECKLIST

Version scope: current project state as reviewed on August 28, 2026.

RELEASE GOAL

Ship Ingredia as a conservative allergy-information utility for iPhone that helps users review packaged food products against a personal profile. The app must not imply medical certainty or guaranteed food safety.

1. MANDATORY SAFETY AND TRUST GATES

- â€¢ Replace any wording that could imply a guarantee of safety.
- â€¢ Keep warning language conservative when product data is missing, incomplete, or unclear.
- â€¢ Ensure every result view reminds the user to verify packaging and manufacturer information.
- â€¢ Review all translations so safety wording keeps the same meaning in Norwegian, English, and Thai.
- â€¢ Add a visible disclaimer in the App Store description and inside the app.
- â€¢ Add a privacy policy and support URL before submission.

Release bar:

- â€¢ No screen should state or imply â€ safe to eatâ€ .
- â€¢ Unknown data must stay 'unknown' or 'caution', not green by default.
- â€¢ Alternatives must never rank highly just because data is missing.

2. PRODUCT DATA QUALITY

- â€¢ Replace the placeholder contact value in the 'User-Agent' header in [OpenFoodFactsService.swift]/(Users/terjemoe/Desktop/MyApps/Ingredia/Ingredia/Services/OpenFoodFactsService.swift).
- â€¢ Decide what country and market behavior should be documented for launch.
- â€¢ Review how category labels from Open Food Facts behave across different markets.
- â€¢ Add clearer handling for stale or low-confidence records if the source data is weak.
- â€¢ Verify that barcodes from several countries return sensible results and do not break ranking.

Release bar:

- â€¢ Barcode lookup works reliably on real devices over normal mobile data and Wi-Fi.
- â€¢ The app handles 'not found', 'offline', 'timeout', and server issues with user-readable messages.
- â€¢ Product data confidence is shown consistently on result screens.

3. FUNCTIONAL COMPLETION

â€¢ Confirm the full core loop is complete:

â€¢ profile setup

â€¢ scan

â€¢ product assessment

â€¢ explanation of findings

â€¢ product data confidence

â€¢ alternative suggestions

â€¢ history

â€¢ restaurant card

â€¢ in-app help

â€¢ Tighten the alternative ranking logic with more edge-case tests.

â€¢ Decide whether users need manual retry controls after failed lookups.

â€¢ Decide whether history should support delete/clear actions before release.

Release bar:

â€¢ No dead ends in the main user flow.

â€¢ The app remains useful when no alternatives are available.

â€¢ Cached products remain readable offline.

4. ACCESSIBILITY

â€¢ Test Dynamic Type across standard and large accessibility sizes.

â€¢ Test VoiceOver on all tabs and result sections.

â€¢ Confirm status is not communicated by color alone.

â€¢ Check contrast in caution, avoid, and data-quality states.

â€¢ Verify button sizes and tap targets.

Release bar:

â€¢ Main actions remain usable at large text sizes.

â€¢ VoiceOver can identify scan, profile, result, and help content clearly.

5. PRIVACY AND LEGAL

â€¢ Draft a privacy policy covering camera use, network requests, and local storage.

â€¢ Draft support contact information and a support page.

â€¢ Confirm no sensitive user profile data is transmitted to external services beyond product lookup requirements.

â€¢ Document that product information comes from Open Food Facts and can be incomplete or outdated.

â€¢ Check App Store review guidance for health-related or safety-adjacent wording.

Release bar:

- â€¢ Privacy policy URL is ready.

- â€¢ Support URL is ready.

- â€¢ Marketing copy stays within what the app can actually guarantee.

6. QA AND TESTING

- â€¢ Expand unit tests for allergen matching edge cases:

- â€¢ false positives from ingredient keyword matching

- â€¢ localized ingredient naming

- â€¢ trace handling with 'rejectMayContain' on and off

- â€¢ multiple allergen conflicts in one product

- â€¢ ambiguous or incomplete data

- â€¢ Add UI tests for:

- â€¢ first-run profile setup

- â€¢ scan flow

- â€¢ failed lookup flow

- â€¢ history reopen flow

- â€¢ language switching

- â€¢ help screen access

- â€¢ restaurant card rendering

- â€¢ Test on multiple device sizes.

- â€¢ Test with low bandwidth and airplane-mode scenarios.

Release bar:

- â€¢ Green build.

- â€¢ Automated tests cover core logic and key user flows.

- â€¢ Real-device test pass with printed barcodes and real product packaging.

7. APP STORE PACKAGING

- â€¢ Create app icon set for all required sizes.

- â€¢ Create launch-ready screenshots for supported devices.

- â€¢ Write App Store subtitle, promotional text, keywords, and description.

- â€¢ Prepare privacy nutrition labels in App Store Connect.

- â€¢ Decide initial availability countries.

- â€¢ Confirm age rating inputs.

Release bar:

- â€¢ Store metadata is complete and consistent with the actual app behavior.

- â€¢ Screenshots do not overpromise medical safety.

8. RECOMMENDED PRE-LAUNCH IMPROVEMENTS

- â€¢ Add onboarding for first-time users.
- â€¢ Add a retry action for lookup failures.
- â€¢ Add a way to delete individual history items.
- â€¢ Consider a dedicated disclaimer screen on first launch.
- â€¢ Improve category normalization for alternative matching.
- â€¢ Add more visible timestamps or freshness signals for cached product data.

9. NICE-TO-HAVE AFTER MVP RELEASE

- â€¢ Favorites
- â€¢ better offline product support
- â€¢ country-aware product prioritization
- â€¢ additional restaurant card languages
- â€¢ manufacturer verification or trust tiers
- â€¢ family profiles and multi-user workflows
- â€¢ subscription or premium tier only after reliability is proven

SUGGESTED RELEASE SEQUENCE

1. Finish safety, privacy, and error-handling gaps.
2. Improve tests and real-device validation.
3. Prepare App Store assets and legal pages.
4. Run a small private beta with allergy-aware testers.
5. Fix beta findings before App Store submission.
